

Project Overview

This eCLINIC app was developed one of the largest super specialty hospitals in India. The app allows you to virtually consult a doctor (through video conference, phone call or by posting a query on the app), book a hospital appointment and access all your medical records. You can search for doctors by specialty, treatment or disease, or let the app recommend a relevant doctor to you based on your requirement.

The comprehensive app also allows you to view your previous health records – reports, prescriptions and discharge notes, and track your current lab and radiology reports. This also allows you to link your family members with your own account so that you can book an appointment for them or even access their health records.

If you are consulting a doctor for the first time, the app registers you and creates your Unique Hospital Identification Digit (UHID). This allows you to skip the registration queue when you visit the hospital for a consultation.

The eClinic Doc app is for doctors to manage OPD consults, namely offline, telephonic, video and in person consults, booked online by patients, on the go!
